**end:**  
**09.11.2025**

## Bruno

### Pressure sores

#### Condition

Bruno presented with pressure related sores over both elbows. On dermatologic exam, the areas showed hair loss, thickened and darkened skin, and draining tracts with purulent discharge.

**Reason:** Bruno is an older dog with mobility limitations due to osteoarthritis. Reduced activity and prolonged periods of lying down caused repeated pressure on the elbows, leading to tissue breakdown and infection.

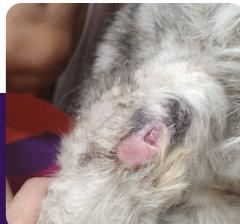

## Bruno

### Pressure sores

Bruno received **Manuka-based** wound therapy with dressings changed every other day. The plan was later adjusted to twice-daily bandage changes with the addition of a veterinarian-prescribed topical ointment.

Wound improvement was visible early in treatment. The **Donut** provided effective pressure offloading while remaining soft yet supportive, staying securely in place during bandaging and normal movement.

**Goal:** Closure and healing of open callused pressure sores

**12.29.2025**

## Blef calluses

**Issue:** Pressure ulcers began to open, requiring additional support alongside other therapies.

**Reason:** Patient under palliative care, mainly bedridden, mobilizes with assistance. Chronic degenerative changes present, but the findings on imaging appeared shortly after onset of lower limb paresis, preventing independent repositioning

## Provider's opinion

Wound Care significantly supported the healing of the pressure ulcer and provided daily protection of the affected area. Initially, dressing application was challenging—particularly in a recumbent patient with a tendency to shift and put weight on the ulcerated side—but after establishing an appropriate application method, it became an effective adjunct to therapy. The dressing effectively protected the wound from excessive heat (underfloor heating), friction, and mechanical stress, as well as from contamination, licking, and, in winter, exposure to salt. In practice, Wound Care facilitated the caregiver's ability to maintain continuous protection between visits and served as an important component of the overall treatment process.

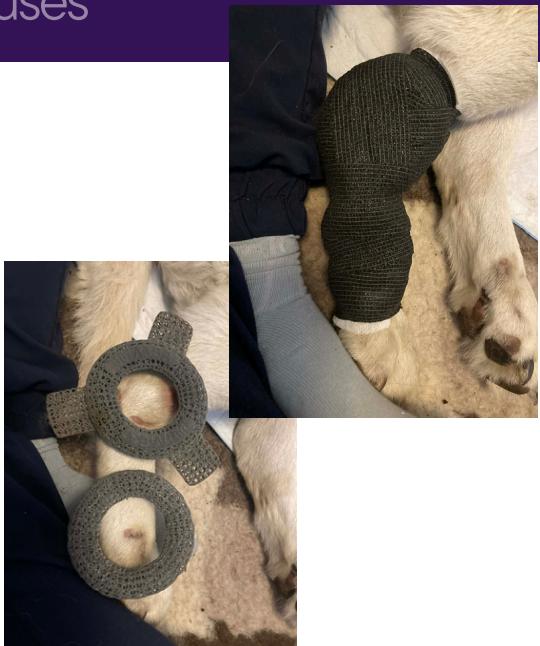

## Blef calluses

### Treatment course / Additional procedures:

Weekly sessions of laser therapy (1R, 4.5 J/cm<sup>2</sup>, 10 Hz).

**Goal:** Closure and healing of open calluses, with prevention of recurrence and **protection between laser therapy sessions** to maintain therapeutic effect.

**treatment time: 69 days**

**start:**  
**12.18.2025**

**end**  
**01.04.2026**

## Huba

### paw laceration

#### **Reason for wound care:**

Activity restriction was applied, but the wound opens during walking — dressing used to protect against mechanical irritation during ambulation.

#### **Cause / Reason:**

Laceration (likely from glass) sustained during a walk on 18.12.2025.

12.21– addition to treatment:

WOUND CARE

morning

evening after the walk

#### **Owner's opinion**

The pad fit perfectly with the physiotherapist's recommendation to have something soft under the paw on every walk (e.g., a folded pad). We'll probably use it again in the future, as the paw is fully healed and the pads are still in great condition. Thank you so much!! :)

# Huba

## paw laceration

### Course of treatment / Additional procedures:

Wimba applied from day 4 after the laceration.

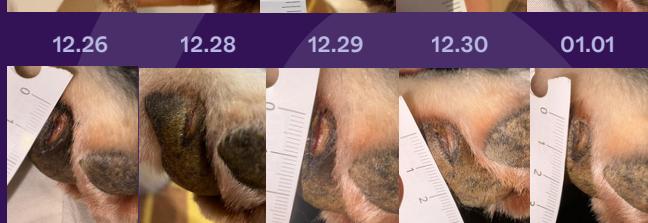

**Leech therapy** on day 3, **Manuka honey** applied at night on days 3–7, and on the remaining days, **Polisept** spray and gel were used.

### Goal:

Protection of the paw pad during walks, providing a soft, insulating layer between the ground and the paw.

**treatment time: 15 days**

# Tobi

## skin lesion

### **Cause / Reason:**

Wound of unknown origin (likely allergic in nature) in a dog with multiple food intolerances.

### **Reason for wound care:**

To accelerate healing by protecting the paw pad during movement.

### **Course of treatment / Additional procedures:**

12.16 – wound disinfected and bandaged.

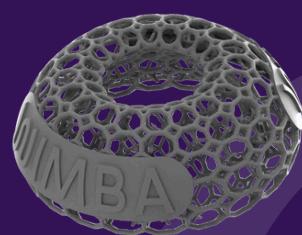

12.17 – Wimba Wound Care Dome added for 3 days (all day plus walks), followed by 7 days for walks only.

**treatment time: 10 days**

# Onyx Calluses

## Reason for wound care:

Calluses that did not reduce despite caregiver interventions; to prevent the calluses from opening.

## Cause:

Young dog with multiple orthopedic issues, prone to lying on hard surfaces.

## Onyx Calluses

### Owner's opinion

From the owner: We use it fairly regularly; I try to put it on every day. In my opinion, it's better. This callus is much smaller and not as dry. For me, it's a lot better. You can see that the red area is healing. You know, even a few millimeters makes a big difference. I think the effect is clearly visible.

# Biffy

## Bandage sore

**Issue:**

Bandage sore on Caudal hock

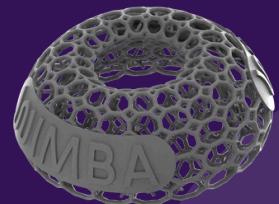

**Cause:** Bandaging of hind limb following surgical wound dehiscence after digit amputation on hind limb

### How did the treatment progress after introducing our product?

No further rubbing of the area, wound did not get worse and surrounding redness improved.

Unfortunately due to open wound already being there wound management still required.

## How to Order WIMBA Wound Care Products

### Step 1: Create and confirm your account

Set up your account in the WIMBA App and confirm your billing and shipping details.

Mobile app:

Download on the  
**App Store**

GET IT ON  
**Google Play**

### Step 2: Send your order request

Once your account is active, please send an email to [help@wimba.vet](mailto:help@wimba.vet) with details of how many units of each WIMBA Wound Care product you need.

Our team will take care of the rest and get back to you with the next steps.

If you have any questions during the process, feel free to contact us — we're happy to help.
